(a) Retrospective onset week vs reporting ratio
pre-specified grid [0.30,1.00] (shaded): weeks 19--20 on both branches
first local report (week 19)
lag 1
lag 2
fixed trajectory ($\tau^* = 19$)
Onset week τ^*
Reporting ratio ρ
(b) Cumulative case thresholds applied to the observed series
three different case rules span 16 weeks; an illustration of definition dependence, not a performance benchmark
500 cases: week 35
100 cases: week 26
first local report: week 19
Cumulative local reports
Analysis week
(c) Cumulative expected reports at the crossing
lag 1
lag 2
range 0.04--2.44 cases: order one, reached with the whole season's fit
Expected reports at τ^* (cases)
Reporting ratio ρ
